

**AMENDMENTS TO THE SPECIFICATION:**

Please substitute the following amended paragraph for the paragraph beginning on page 8, line 16.

If the client data is not raw Postscript, a job parser **524** receives and sorts the data from the Postscript parser **510**. With regard to job parser **524**, the term 'job' is a print job which includes documents. If the client data is not recognized, job parser **524** routes the data stream to the AppleTalk protocol module **202**. If the data is print data, the job parser **524** routes the data to cover page parser **526**. The cover page parser **526** examines the print data and routes any print data that is not cover page data to user data module **528-530**. If the print data is cover page data, cover page parser **526** routes the data to cover page module **530-528** which modifies job flow to introduce and handle a cover page document. Cover page module **530-528** tags the print data as a cover page and generates a new document for the actual job before returning the data stream to the user data module **202**. If the print data is a standard user document, the user data module **528-530** gleans any user data to the job structure and returns the data stream to the AppleTalk module **202**.
